History AutoCAD (r) was originally developed by Allen Browne in 1982. He was later joined by Mike Jaquith. When the third version, AutoCAD (3D) was first released, Browne and Jaquith each had 30% of the code, a split which continued to this day. On October 20, 1997, Browne and Jaquith announced they were leaving Autodesk. A year later on October 20, 1998, Browne and Jaquith sued Autodesk for copyright infringement, alleging that Autodesk had illegally copied their computer code. During the lawsuit, Browne died. On March 15, 2004, the jury returned a verdict in favor of Autodesk. On May 17, 2004, Browne and Jaquith dropped the lawsuit. A group of former AutoCAD developers was later hired by Autodesk to develop AutoCAD. They created AutoCAD 2008, which was first released in February 2008. AutoCAD 2010 was released on December 15, 2009. AutoCAD 2013 was released in August 2012. AutoCAD 2014 was released in December 2013. AutoCAD 2016 was released in August 2015.

The SCAM of “clean energy” costs us more than we can ever imagine. Why “clean” energy is NOT going to “save us”. When Dr. Svalgaard adds up all the costs involved in producing the electric and fossil fuels that are used to generate electricity, which includes not only the capital and operating costs of producing electricity, but the costs of disposal of the non-recyclable materials that are the byproducts of the electricity production process, he finds that the total cost to obtain a kilowatt-hour of electric power is twice the cost of obtaining a kilowatt-hour of coal-fired electricity: 1) The first cost of producing electricity is that of the electricity itself, as mentioned in part 1 of this document. Electricity is not free. 2) The second cost of producing electricity is that of disposing of the non-

recyclable byproducts of electricity production, specifically the plastic and glass that are produced by the process.

We do not recycle plastic and glass. Not only is this true of plastics, but glass is non-recyclable as well. These materials go into landfills, which takes more natural resources and space than burning coal, oil or natural gas. 3) The third cost of producing electricity is that of disposing of the radioactive byproducts of electricity production, especially tritium, which is a radioactive isotope of hydrogen, and radium, which is the waste product of the decay of radium a1d647c40b
