* _What features are available in Photoshop?_ Any image can be edited in Photoshop using the tools and layers described in this chapter. In addition to the tools, you can use a Creative Suite Program—a collection of graphics applications that includes Photoshop and other editors. * _How do I add layers?_ With every image, Photoshop creates a default layer, called the Layer 0. To add layers, drag the layer icon from the Layers palette to an empty layer. This adds the image to the layer stack and changes the default layer to the new layer. To edit the content of the new layer, you must change the layer to a new layer. Adobe recommends you use the Camera, Shoot Photo, and Photoshop layer for the initial layers in each image. Start with these layers and add more as you edit. Layers are primarily used to provide visual control over the content of a file. You can use a layer to create a new, and different, image when you create a new layer. Over time, you may add a layer to add, say, a new adjustment layer or a color overlay layer, and then you can use that layer to make the image a new look. You can also use a layer to add and alter images in an image you have already created. You can open an image in Photoshop and make changes using a Layer mask as a control. # Changing an Image You can work in Photoshop with your image as a single layer, but you can layer images within a single image by using layers. The new layers are a visual representation of layers and can be used to create edits to the image. To change an image, you must open the image in Photoshop and make the changes to the image, as described in the following steps: 1. **Open the image you wish to modify.** The image must be open in Photoshop before you make any changes. Photoshop saves changes to image files in a lossless way, meaning that all the information in the file is retained after the changes are made. 2. **Click the Image Size icon at the top of the Layers palette, and then select a size and resolution that fits the new edits you want to make.** The Image Size dialog box opens, enabling you to choose a new size and resolution for the image. Your selected size, pixels, and resolution options are specified in the dialog box when you choose your Image Size icon. 3

It might be useful to combine several exposures of the same subject to remove unwanted objects, dirt, or other changes. Just open a new image, duplicate the original image and the unwanted objects, and paste them back into the new image. Brush Scripts allow you to change the behavior of the brush strokes, which can turn a simple painting into a work of art. Layers are used to combine multiple images into a single composite image, then organize the layers in a hierarchical manner that allows you to move each layer independently. Degree tools let you create gradients in a number of ways, letting you create different artistic effects in one step. The Gradient tool lets you create special effects with color variations. The Pen tool lets you draw objects without using a brush, allowing you to create more complex shapes, lines and curves. The Blur tool lets you blur the edges of an image or combine two images to create a blurring effect. The Smudge tool allows you to remove portions of images. The Eraser lets you remove areas of the image, including areas of multiple layers. The Dodge and Burn tools let you colorize an image, converting an image to grayscale or making it darker or lighter. The Levels tool allows you to adjust the lightness and darkness of an image. The Burn tool lets you even out the colors of an image. The Spot healing brush is used to remove or correct errors in an image. The Brush features in Photoshop let you resize, colorize, and customize the shape of the brush. **Figure 10-1:** You can change how the brush itself behaves to get different types of effects, such as the Brush Script (image by _Eric Fischer_). Photoshop's Magic Wand tool allows you to select the areas in an image that belong together. **Figure 10-2:** It's easy to create copy/paste layers, such as these layers from an oil painting. The Filters tools allow you to modify the appearance of images in several ways. The Blur tools are used to reduce the number of pixels in an image, blurring the image and creating varying levels of blur. The Sharpen tool is used to optimize a rough or blurry image, improving clarity and sharpness. The Invert tool inverts the image to create a positive image from a negative one. The Channel Mixer tool lets you change the color properties of

Q: Filling ViewModel with properties using CodeFirst to the database I am working on an application using ASP.NET with Identity and Entity Framework Core. The application will be accessed by mobile devices. I am working on the logic for data storage. I am using ViewModels to store the raw data of the Users of the application. My goal is to fill the ViewModels from the database. Now my question is: Is it possible to set the properties of a ViewModel on the database or is it necessary to always filter the ViewModels? I already thought about adding a new table to the database, containing all the fields of my ViewModel, but I am unsure if that is the best way to do it. This is the ViewModel: `public class UserIdentityViewModel { public string Username { get; set; } public string PasswordHash { get; set; } public DateTime? Created { get; set; } public DateTime? Expires { get; set; } public DateTime? AccessToken { get; set; } public string RefreshToken { get; set; } public string TokenType { get; set; } public string AccessTokenType { get; set; } }` The ViewModel is filled with the properties Username, PasswordHash, ..., TokenType. I already tried the following: Example 1 - pass all the fields to the database and hide the properties of the ViewModel (this works but it seems like a bad solution to me): `User user = context.Users.Include(v => v.Roles).FirstOrDefault(); foreach (var item in user.Properties) { context.Entry(user).Property(item.Key).IsModified = false; } context.Users.Add(user); await context.SaveChangesAsync();` Example 2 - Pass only the properties to be filled in the ViewModel and not the properties to be filled in the database:
